List of modules/templates/extensions that I would use If I am to make an E-commerce website

- Mosets tree extension
 - This extension contains multiple features that focuses on managing the directories/modules/categories that will greatly benefit the UI specially of the user. It also has a user profile feature that will display information about the user and their current status.
- Map search module
 - This module will help the tracking of orders and the location of the delivery.
- Shopping cart module
 - This module will be useful to allow users to stack and buy multiple products.
- Payment module
 - This module will handle the process of the payment transaction between the seller and the buyer.
- Affility Template
 - I chose this template because it has a clean and simple design and has only 1 color scheme which I think will also benefit the users not having confusions while using the website.
